

Seamless Wallet API

Below are the wallet callback methods that the integrator must implement.

Endpoint	Description
Balance	Get player balance
Bet	Place a bet
Win	Award a win
Rollback	Refund a failed or invalid bet
Round Info	Round summary information

Multi-Bet Rounds

Some game types (e.g. crash games) allow a player to place **multiple bets** within a single round. Each bet receives its own corresponding win — including losses, which are sent as a win with `amount: 0.00`.

The aggregator sets `round_finished = 1` on the **last win** of the round. The operator does not need to track how many bets are outstanding — simply process each bet/win as it arrives and close the round when `round_finished = 1` is received.

Example — crash game, player places 2 bets:

```
Bet1  txn=B001  amount=5.00  round_id=R1  (round_finished=0)
Bet2  txn=B002  amount=3.00  round_id=R1  (round_finished=0)
Win1  txn=W001  parent=B001  amount=10.00  round_id=R1  (round_finished=0)
← cashout at 2x
Win2  txn=W002  parent=B002  amount=0.00  round_id=R1  (round_finished=1)
← crashed, round closed
```
